

1.1 Define Problem Statements

Auto Ticket Classification using Flow Designer

Problem Statement

The school IT helpdesk receives many incident requests every day from students and teachers, such as Wi-Fi issues, projector failures, password problems and slow computers. Today, IT staff read each request manually and decide its category, priority and the team that should handle it. This is slow, causes delays, and sometimes sends tickets to the wrong team.

Customer Problem Statement Template

I am	Describe customer	I'm trying to	But	Because	Which makes me feel
Teacher	A school teacher who depends on projectors, Wi-Fi and school systems for daily classes	Report an IT problem and get it fixed quickly before my class starts	My ticket waits in a queue and gets assigned to the wrong team	Staff classify every ticket manually and the volume is high	Frustrated and worried about lost teaching time
Student	A student who needs login access and working lab computers	Reset my password or report a slow computer and continue my work	I wait a long time and have to follow up again and again	Tickets are not prioritised or routed automatically	Stressed and unsupported
IT staff member	Helpdesk technician handling many incidents	Resolve urgent issues first and handle the right category of ticket	I spend time reading and sorting tickets instead of fixing issues	No automatic classification or assignment	Overloaded and unproductive

Problem Statement Summary

Problem Statement	I am	I'm trying to	But	Because	Which makes me feel
PS-1	School user (student or teacher)	Get my IT incident resolved fast	Tickets are classified and assigned late or wrongly	Manual review by IT staff	Frustrated
PS-2	IT helpdesk staff	Focus on solving incidents	Time goes into reading and sorting tickets	No automation in the workflow	Overloaded
