

1.3 Brainstorming and Ideation

Auto Ticket Classification using Flow Designer

Step 1: Team Gathering and Problem Selection

The problem selected: manual classification and routing of school IT helpdesk tickets is slow and error-prone.

Step 2: Brainstorm - Ideas Listed

- Auto-classify tickets using keyword rules in ServiceNow Flow Designer
- Auto-set priority from category and keywords such as 'urgent' or 'exam'
- Auto-assign the ticket to the right support group
- Send an automatic acknowledgement email to the requester
- Dashboard showing tickets by category and status
- Use an ML or GenAI model for tickets that rules cannot classify (future scope)

Step 3: Idea Prioritisation

Idea	Impact	Effort	Priority
Flow Designer rule-based classification	High	Low	1 - Selected
Auto priority and assignment	High	Low	2 - Selected
Auto acknowledgement notification	Medium	Low	3 - Selected
Reports and dashboard	Medium	Medium	4 - Optional
ML / GenAI classifier	High	High	Future scope

Selected Solution

An automated flow built in ServiceNow Flow Designer that triggers when an incident is created, reads the short description, classifies the ticket into a category, sets priority, and assigns it to the correct support group without manual effort.
